Test Scripts

Before the test starts, evaluators need to find a quiet environment, bring blindfolds, headphones, and a computer to the place that has internet. Also, you need to download and print all the documentation needed for the test including the user manual and installation guide, Usability goals, Usability test plan, and all the test materials.

Before the test subject (user) arrives, evaluators need to set up the test environment. This involves preparing the computer, going to our computer prototype notebook (https://www.cs.mcgill.ca/~lduan5/hci/notebook/Computer-Prototype.html) to review all the documentation, and going to our computer prototype page (https://www.cs.mcgill.ca/~lduan5/hci/notebook/comp_proto/welcome.html).

When the users come, you need to read the user introduction and the user task to them and let them read the user manual carefully. Also, please let them fill the pre-test questionnaire. When the test starts, let them put on the blindfolds and the headphones and guide them with the user tasks when they are lost. Please don't tell them how to do a task but what to do! Please don't interrupt, give clues, or tell them how well they are doing. Please treat users and our test with kindness and patience. When the test is done, please tell users to fill out the post-test questionnaire and thank them for participating in the test. Thank you for helping us evaluate the test!
